General Description

The G2224 is a high efficiency single inductor Buck-Boost converter which can supply the load current up to 4A. It provides auto-transition between Buck and Boost Mode. The G2224 operates at 2.4MHz and it can also be synchronized with external frequency from 2.2MHz to 2.6MHz. DC/DC converter operates at Pulse-Skipping Mode at light load. The Power Save Mode can be disabled, forcing the G2224 to operate at FPWM Mode. The output voltage is programmable using an external resistor divider, or is fixed to 3.3V internally. The load is disconnected from the VIN during shutdown.

The G2224 is available in TDFN3X4-14 package.

Layout Considerations

PCB Layout Guide

Careful PCB layout is critical to achieve clean and stable operation. It is highly recommended to duplicate the G2224 evaluation kit layout for optimum performance. If deviation is necessary, follow these guidelines for good PCB layout:

- Place the input and output capacitors as close as possible to the input and output pins.
- Keep the main power traces as wide and short as possible.
- Connect the GND and Exposed Pad to a strong ground plane for maximum thermal dissipation and noise protection.
- Switch node experiences high frequency voltage swings and should be kept in a small area. Keep analog components away from the switch node to prevent stray capacitive noise pick-up.
